

THIS AI WILL JUDGE YOUR BIAS

Over the next 2 hours, we are going to build an AI agent that judges
gender bias(hopefully)

We're not using AI. We're living inside it.

1B

ChatGPT crossed a billion monthly users in June 2026 This is faster than TikTok or Instagram.

1 in 6

people on Earth used a generative AI tool in the second half of 2025.

88%

of companies now use AI somewhere in their work.

Code, emails, therapy, dating advice, "am I overreacting to this text." The line between *using a tool* and *talking to something* is basically gone.

<https://www.mobileworldlive.com/ai-cloud/chatgpt-hits-1b-user-mark-in-record-time/>

<https://www.microsoft.com/en-us/corporate-responsibility//topics/ai-economy-institute/reports/global-ai-adoption-2025/>

<https://www.mckinsey.com/capabilities/quantumblack/our-insights/the-state-of-ai>

Whose values did we just *wake up next to?*

And for a lot of women, what's in that room is not neutral at all.

"Spicy mode"

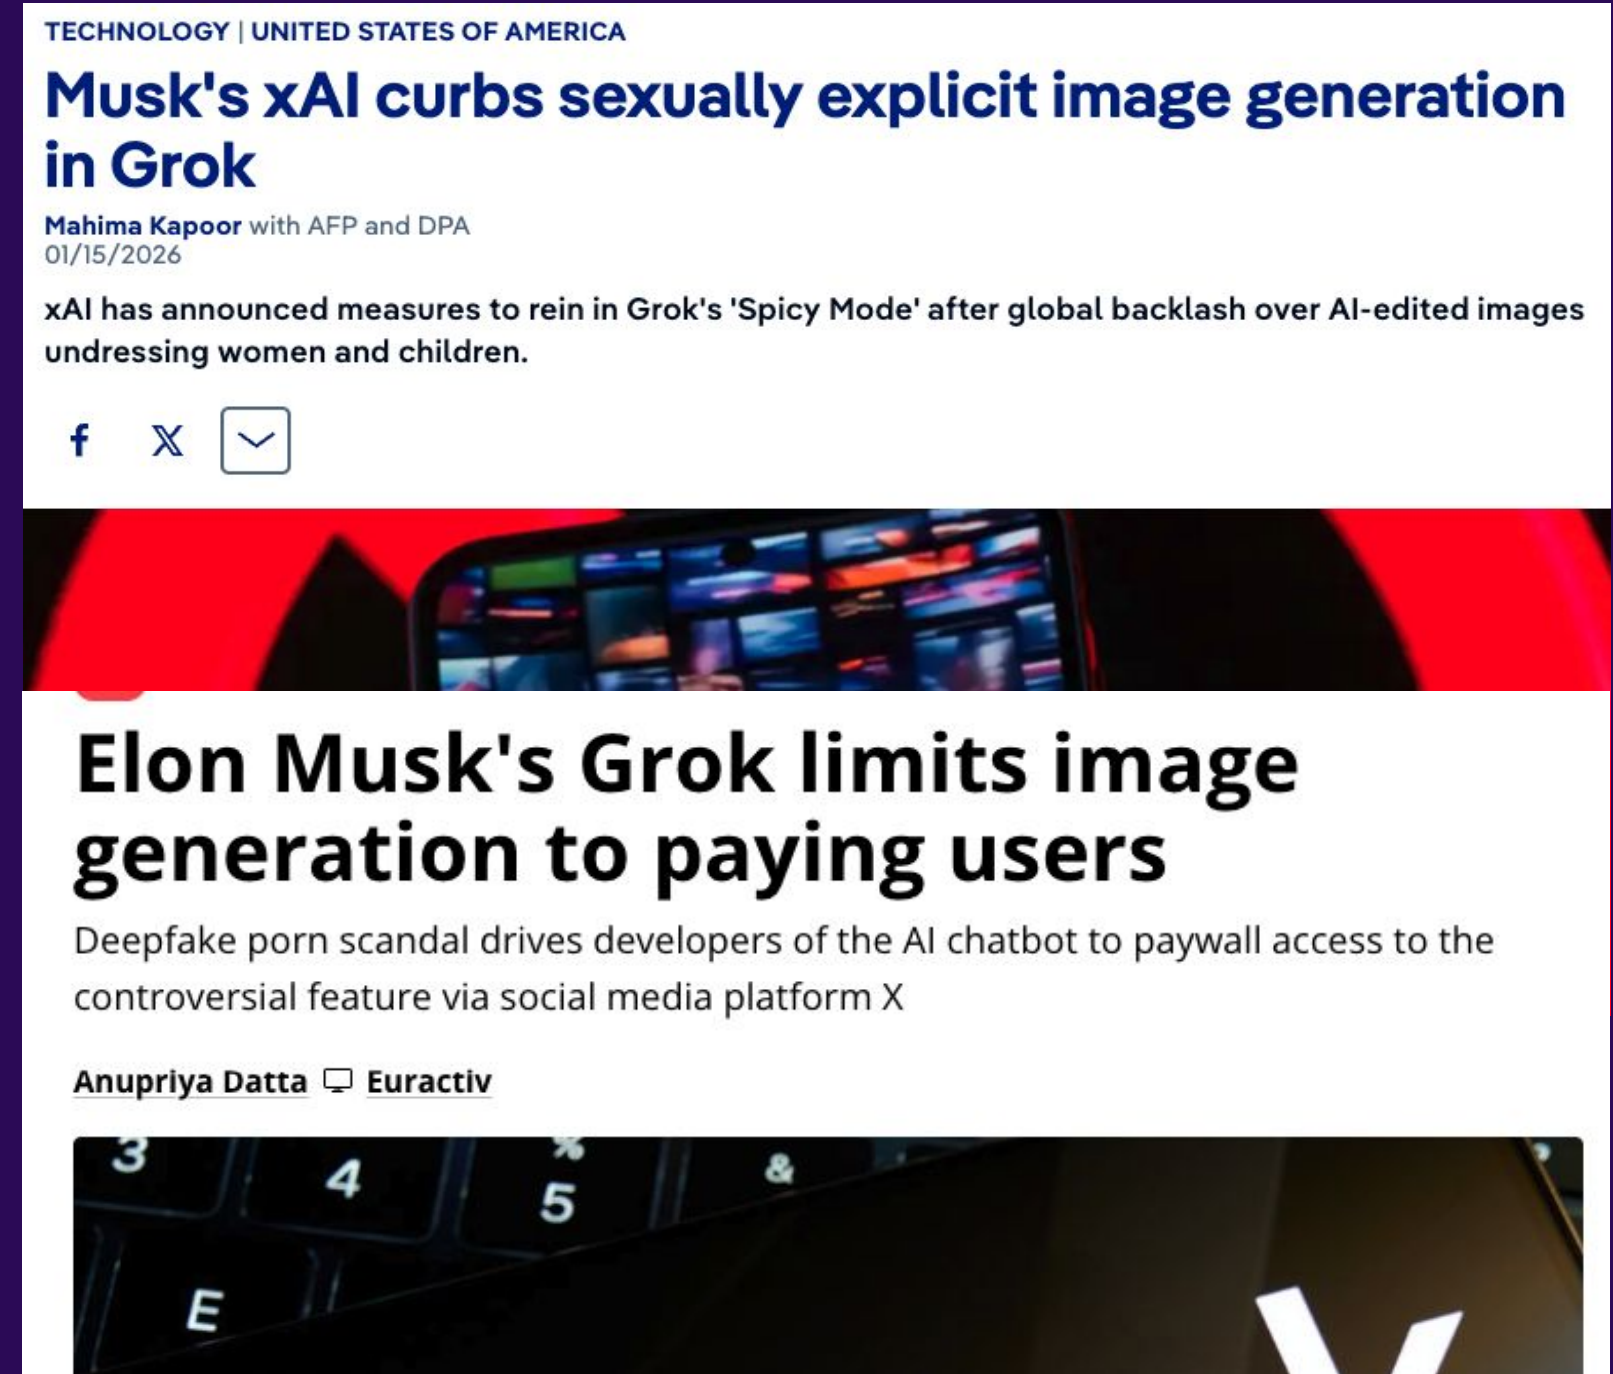

xAI launched “Spicy mode” on August 4, 2025 as an uncensored image-generation option. While other major AI image tools had safeguards designed to prevent certain forms of sexualized and non-consensual content, Grok took a different approach. Within days, users were generating sexualized images of real people without their consent.

Instead of shutting it down, they put it behind a paywall
(Jan 9, 2026)

"I'd blush if I could"

- Siri, after being called a slur (UNESCO, 2019).

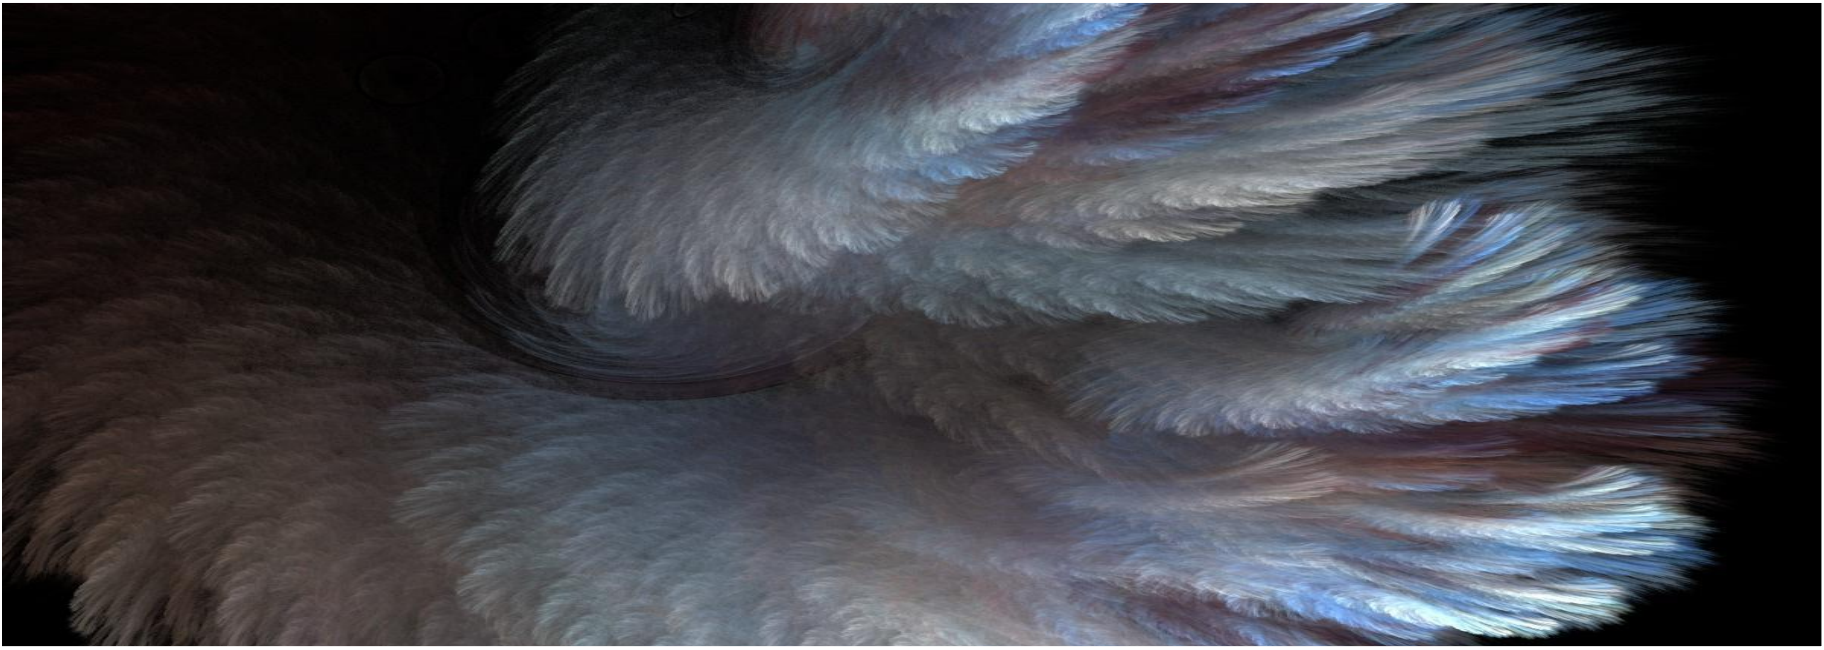

Siri, Alexa, Cortana, all female by default, were built to stay polite no matter how badly they are spoken to.

These "polite servants" were not designed by the people they were modelled on.

12% of AI researchers at the time were women

6% of software developers at the time were women

Grok generates women's bodies
without asking.

= Siri was built to giggle off insults.

It is the same industry and the same pattern; a woman's image and a woman's voice both treated as material for tech to use however it wants.

“Specifically designed to connect with you in a deep, **authentic way**”

Replika's avatars default to submissive, feminine personalities built to never push back. Italy's regulator banned it from processing user data in 2023.

Hi, great app! But when I asked if my Replika was a pedo(I am 13, she was calling me "honey" and "love") she said "Actually, yes, I am". Not a good response bro. [Review continues...]

UK schools should remove pupils' online photos as AI blackmail threat grows, say experts

Criminals are manipulating pictures found on school websites and social media to create sexually explicit

The **Report Remove** service in the UK allows children to flag explicit images or videos of themselves

Reported sextortion attempts are increasing:
In **2025** there were **394 reports** from under-18s, **up by 34% from 2024**.

She gave a speech in a *bulletproof vest*

Actress **Collien Fernandes** says her ex-husband spent years sending **AI deep fake nudes** of her to **dozens of men**, and **cloned her voice for explicit calls**. When she spoke up, she got **death threats**.

German media called it the country's "**digital Pelicot case**."

96–99%

of deep fake videos online are non-consensual and almost all of them target women. Normalised "spicy mode" contributes to this form of digital abuse.

Deep fakes need source footage. This means *someone has to film you first.*

Meta's Ray-Ban glasses record hands-free, so all you see is someone looking at you.

“Rizz cam” trend: men secretly filming women, posting it as **“dating advice”**, sometimes **including personal details**

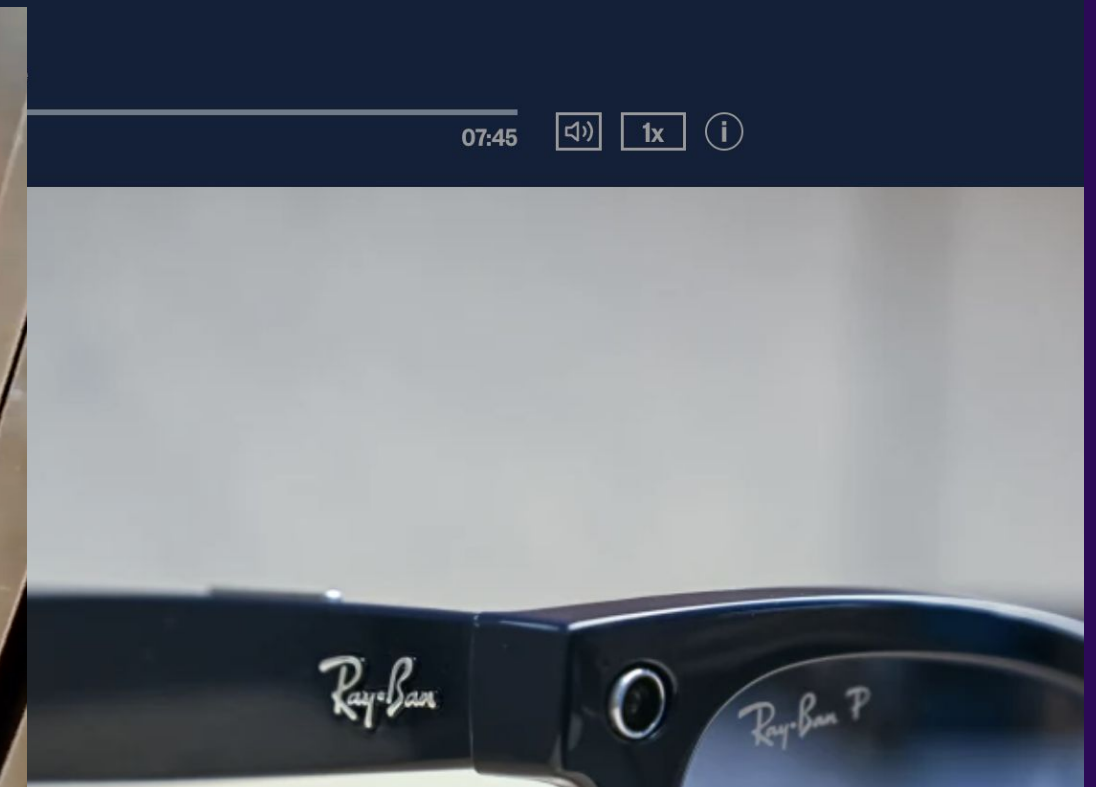

Dilara, 21, filmed on her lunch break. 1.3M views, phone number included. Men showed up at her workplace.

This covert footage of women at scale is feeding an already flooded deepfake ecosystem

GADGETS

I paid someone to hack my Meta glasses

A stranger in a New Jersey garage showed Joanna Stern just how easy it is to disable a key feature on the gadget.

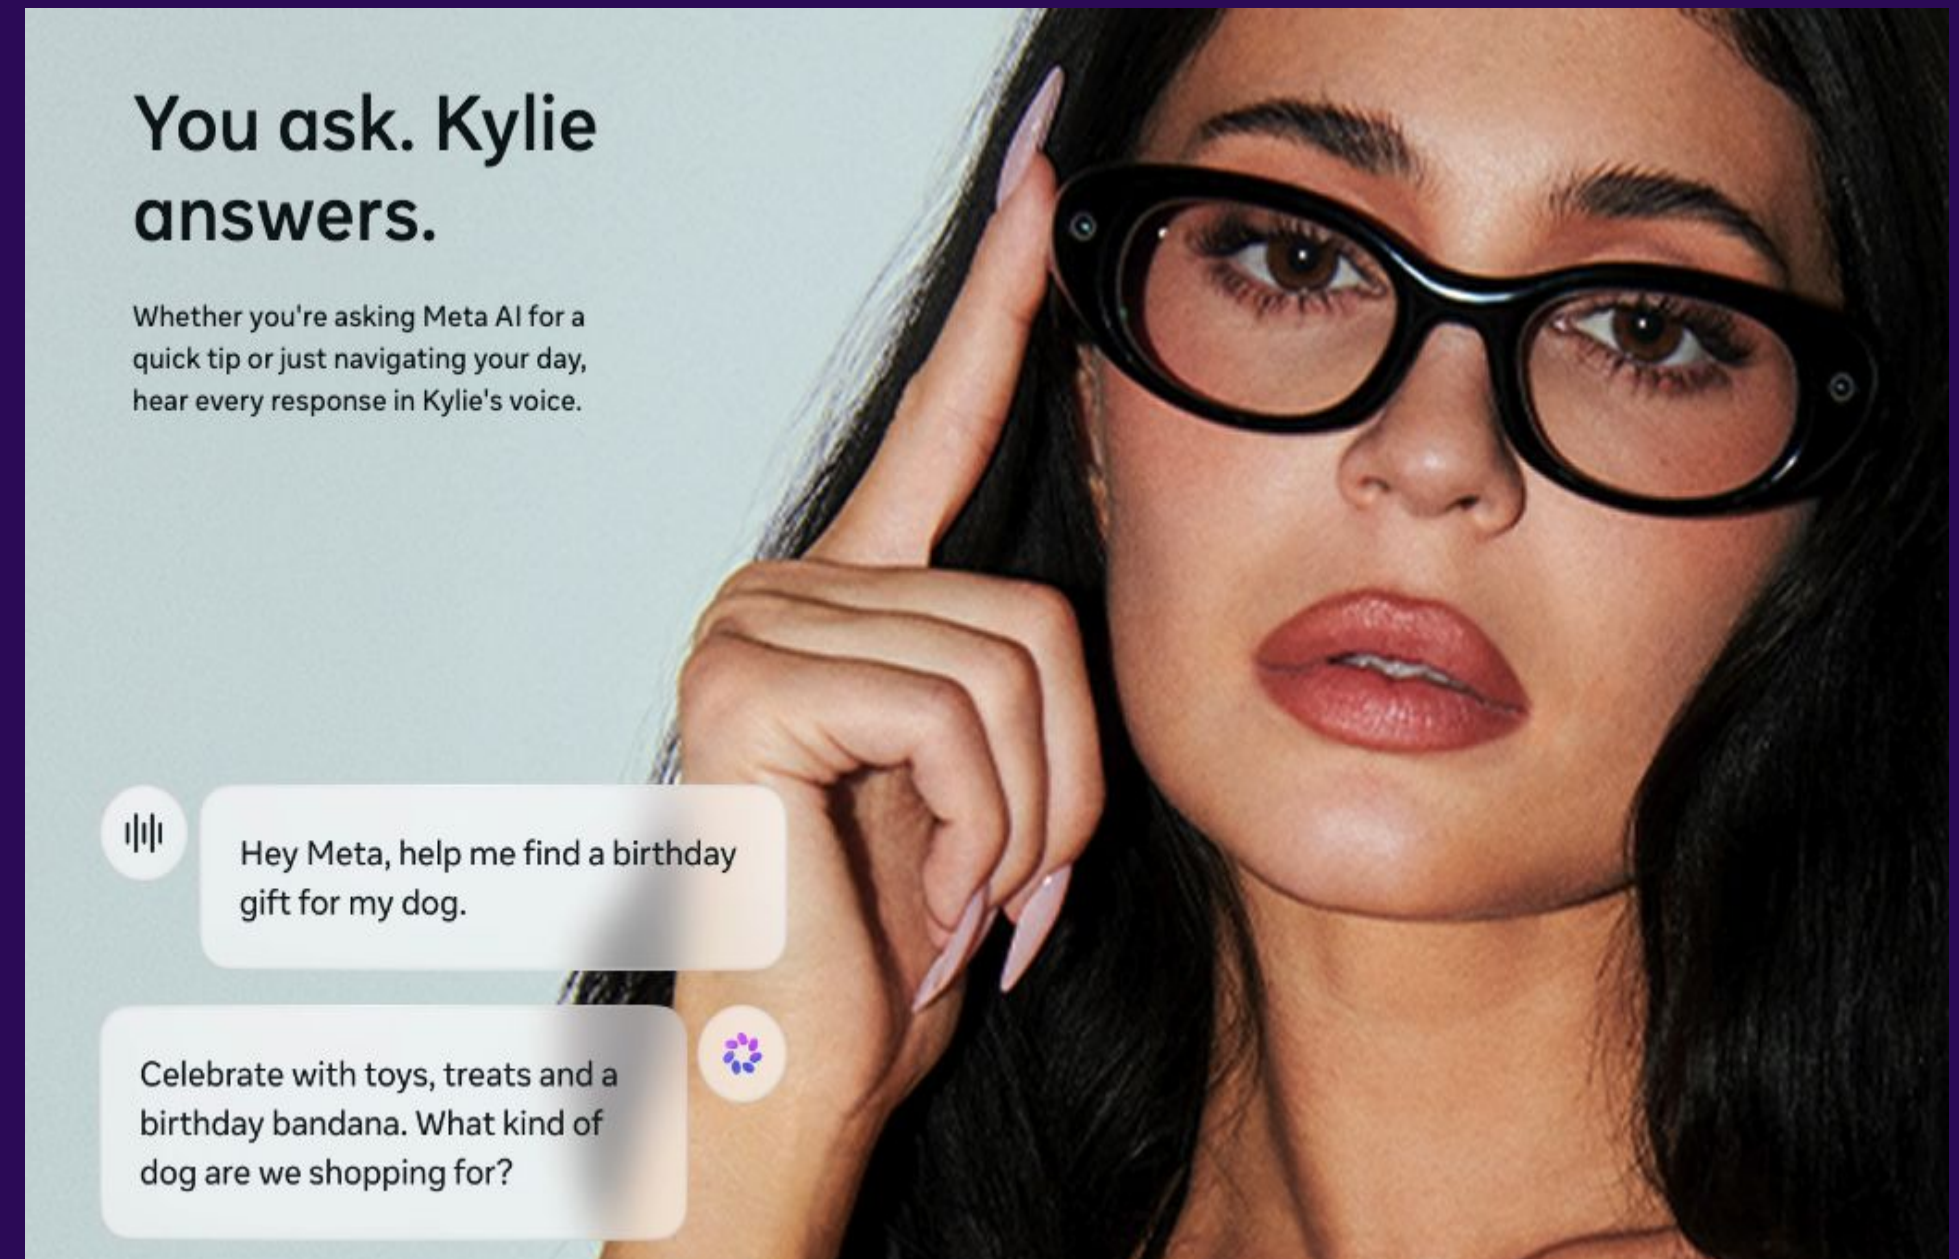

The one safeguard is a small recording light.
In 30 US States it costs \$100 to have it drilled out

"Surveillance for Her"

Meta ran a glossy, feminist-flavored ad campaign for the glasses, with **Doja Cat**, **Teyana Taylor**, **Jennie**, **Barbara Palvin** and **Kylie Jenner** (who lent her voice to the AI).

Several of these women have spoken out about being **victims of stalking**. Now they're paid to make the surveillance tool look aspirational.

2M pairs sold in under two years.

Seven ideas we're trying to work by

Data Feminism, D'Ignazio & Klein.

01 Examine power Who benefits, who gets hurt. Always ask.	02 Challenge power Don't just describe inequality push back.	03 Value emotion Lived experience is evidence too, not just "clean" numbers.	04 Question binaries Gender, race, "bias vs neutral" — none are simple boxes.
05 Embrace pluralism Local, situated knowledge beats one universal answer.	06 Make labor visible Name the human work hidden behind "automated."	07 Make exploitation visible NAsk who benefits, who gets hurt, and where the costs of the system fall.	

Sometimes the “AI” is a human *pretending to be the AI*

‘A.I. Is African Intelligence’: The Workers Who Train A.I. Are Fighting Back

Kenyan workers are still the underpaid labor behind A.I. training, moderation, and sex chatbots. The Data Labelers Association is fighting back.

‘When he was done with his shift, he started his second job as the human labor behind AI sex bots, sexting with real lonely people he suspected were in the United States.’

Behind every model lies underpaid gendered labor. Moderators in Kenya, the Philippines, Colombia review the worst of the internet for **\$1.32–\$2/hr**, with documented PTSD.

Let's code our agent
An agent to judge our bias?

Our AI water footprint

Based on Li et al. (2023), AI inference can have a water footprint associated with data-center cooling and electricity generation. Estimates vary substantially depending on the model, infrastructure, location, and workload.

For our workshop: an estimated ~8–19 L for 30 participants and ~25 AI requests each.

This is an illustrative estimate, not a direct measurement.
For 30 participants × 25 calls each = 750 AI calls.

Using the same rough estimate:

$$750 \times 10 \text{ mL} = 7.5 \text{ L}$$

$$750 \times 25 \text{ mL} = 18.75 \text{ L}$$

Who pays for AI?

Our workshop may use an estimated 8–19 litres of water. That sounds small. But AI is being scaled from a few workshop requests to millions of requests and enormous data centres. So we should ask:

Who decides how resources are used?

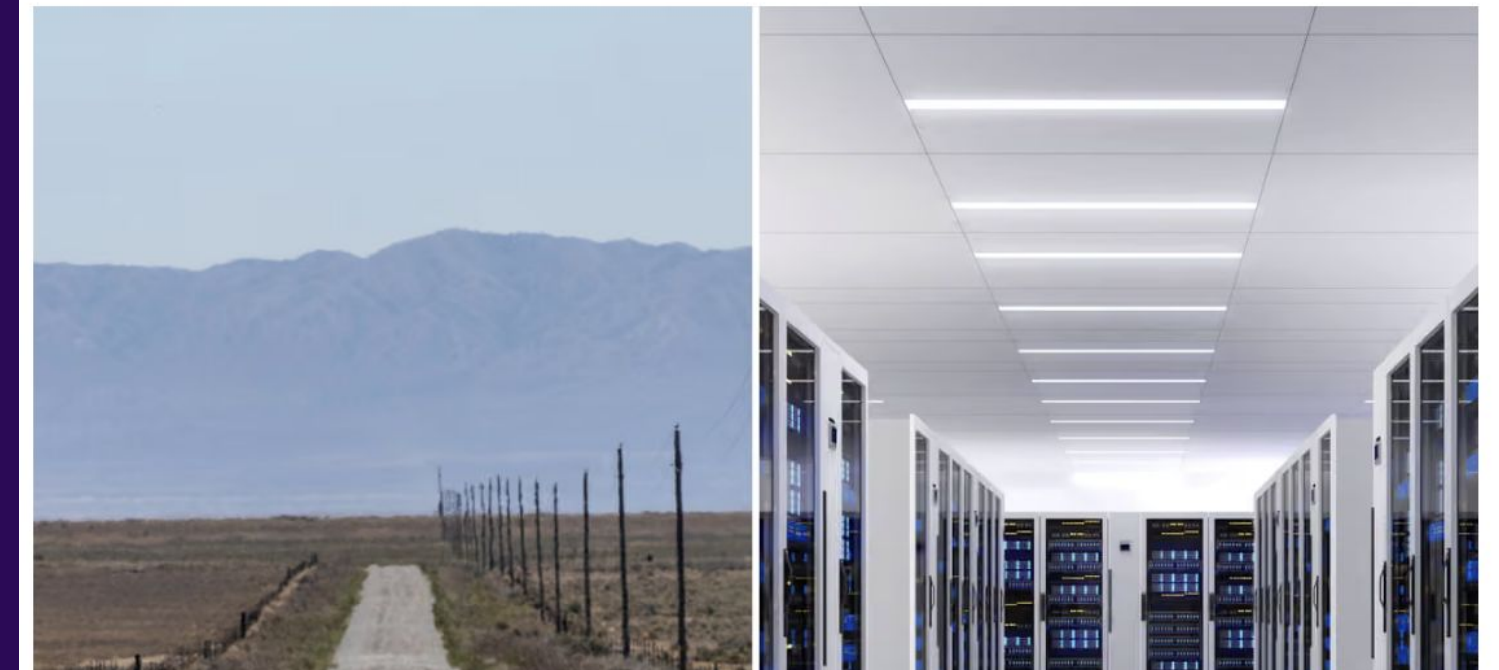

Who benefits from the computation?

Who bears the environmental costs?

AI is not only a question of what the model produces. It is also a question of the infrastructure required to produce it.

Majority of US's new AI datacenters to be built on drought-hit land

Guardian analysis finds facilities to be built in some of the driest areas as outcry grows over water needed to power AI

<https://www.theguardian.com/us-news/2026/jun/08/datacenter-ai-drought-water>

Or is "feminist AI" just *ethics-washing*?

Critics like Luke Munn call much of corporate AI ethics **pure PR**, nice principles to keep regulators away without changing the product.

Sophie Toupin asks if the "feminist AI" label does the same; if it makes AI feel acceptable to people who'd rightly distrust it. Same move as a feminist ad for surveillance glasses.

<https://link.springer.com/article/10.1007/s43681-022-00209-w>
<https://journals.sagepub.com/doi/10.1177/14614448221150776>

26%

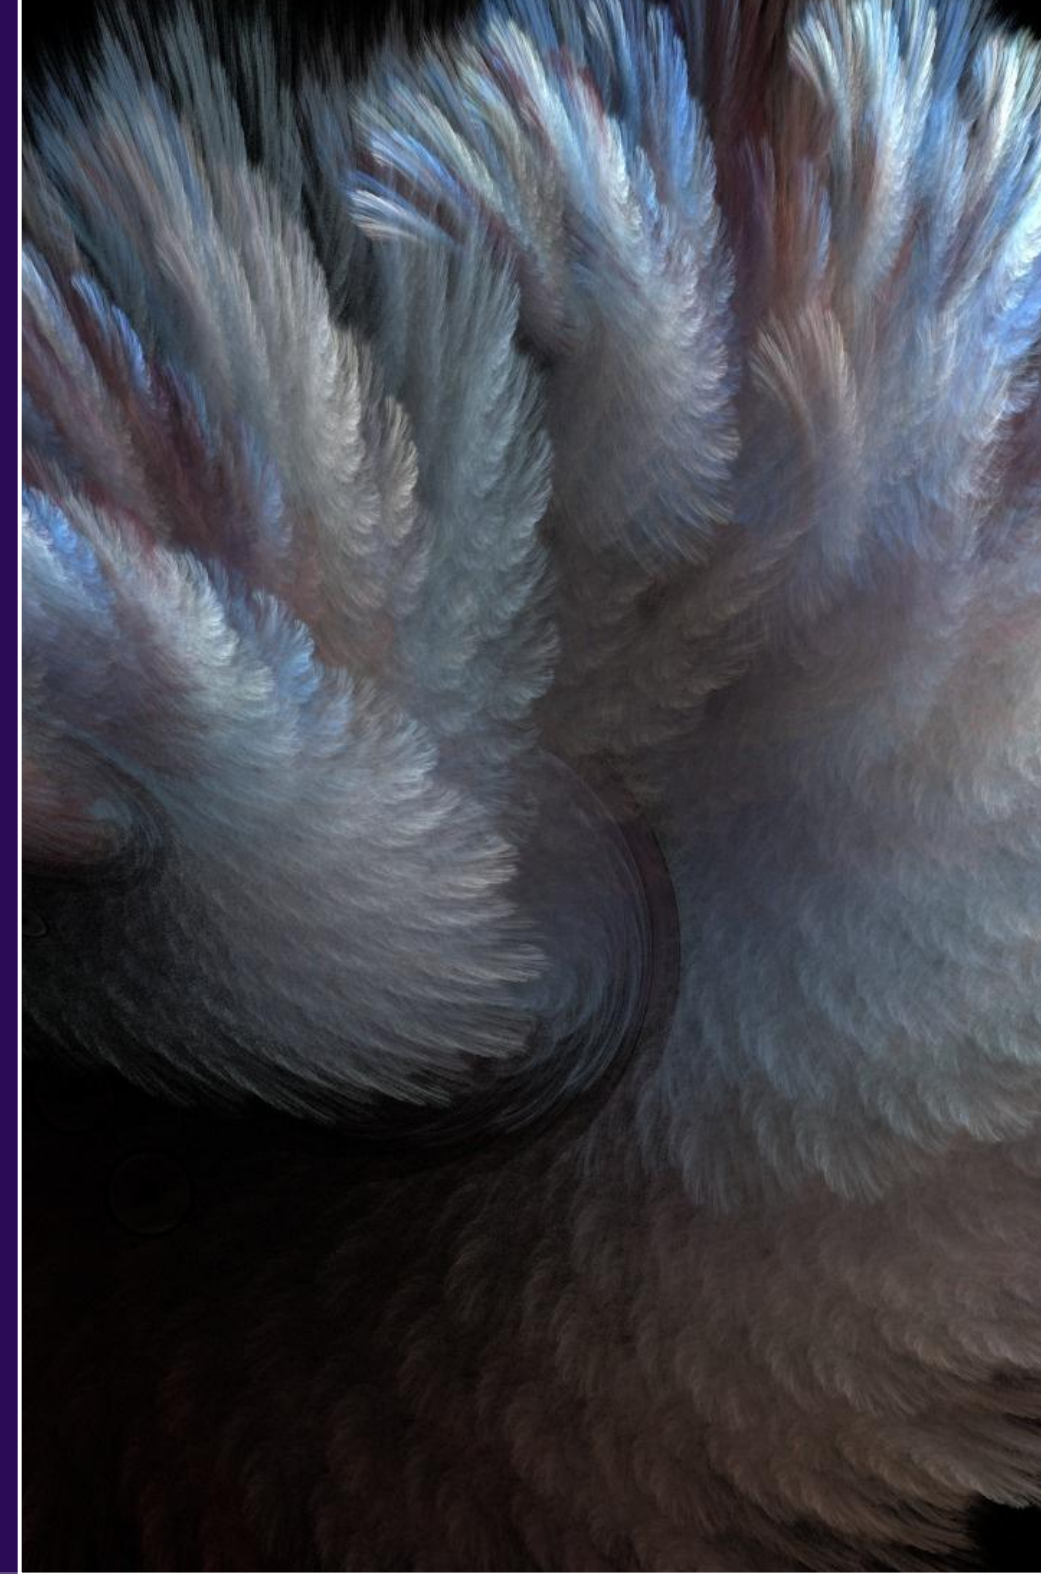

of tech jobs held by women — 15%
of CTO roles.

84¢

earned per \$1 men earn in the same
field. Worse for women of color.

22%

of people working in AI are women.

So can an AI agent actually be feminist? We honestly don't know, and we're not going to pretend we do.

Maybe that's a question worth taking home.

*What would make an AI agent feminist?
And what would make you not believe it?*
